

Crash and fall incidents

One row per crash point already exported in trips.geojson. 10 incident(s). Context fields are derived from stored trip segments; incident detection is not rerun.

Source: trips.geojson
Scope: Existing classified incidents and stored trip measurements

Coordinates are shown to the precision stored in the GeoJSON. 'Standstill / recovery' is the exported recovery_time_s: the gap from wheel stall to the next distinct wheel-rotation reading. 'Avg/peak pre-impact decel' is based on stored GNSS braking_intensity values in the 5 seconds before the crash.
